MuniPricer Work in Progress

Anubhav Awasthi, Ibukun Agbaje and Eno Okon · BUS 43100 AI Essentials · November 4, 2026

Everything below is live and viewable without a login. All accuracy figures come from simulated trade data until we retrain on real MSRB trades in week 7.

What	Link	What it shows
Live app	munipricer.streamlit.app	The working tool: CUSIP lookup or manual entry, buy or sell side, trade size, price with an 80% range, and a chart of what moved the price
Code and version history	github.com/anub-awasthi/munipricer	Full source, commit history, automated tests that run on every push
Evaluation report	reports/evaluation.md	Rolling backtest over four test windows, ablations, error analysis with charts
Web demo	MuniPricer demo	No-install version with precomputed predictions for 2,731 bonds
Real-data pipeline	pull_wrds.py, load_msrb.py	Pulls MSRB trades from WRDS and cleans them into the model's format, with a load report

Try it in a minute. Open the live app and press Enter on the example CUSIP. Switch between "Buying from a dealer" and "Selling to a dealer" and watch the price move by the dealer markup. Then switch to "Enter the details myself", leave "I know the last trade" unchecked, and see how much wider the range gets for a bond with no history.
